

MASTERING-GRADE AUDIO COMPARISON & QC

RTMcompare

Hear what Spotify hears.
Before Spotify hears it.

MACOS · WINDOWS · LOCAL-FIRST

THE FRICTION POINTS

Your mix translates differently on every system.

Your master goes 6 dB quieter once Spotify is done with it.

Your bounce has a 6 kHz tone you didn't notice until a producer flagged it.

Your delivery gets cancelled because of a comma in a track title.

Nobody tells you why until the email arrives at midnight.

WHAT IT IS

A desktop tool
for engineers and producers
who care what the platforms do
to their work.

Mixing engineers comparing revisions. Mastering engineers shipping deliveries.

Producers checking bounces. Same tool, three doors in.

WHAT RTMCOMPARE ACTUALLY DOES

Ten surfaces. One file or two or a folder.

COMPARE TWO FILES

- Level-matched playback to -18 LUFS
- Per-band masking via AI stem separation
- Phase correlation per band + over time
- Vectorscope with peak-hold
- Inter-sample peak meter (4× oversampled, BS.1770-4)
- Streaming-normalisation preview · 7 platforms
- Engineer-profile match · concrete EQ moves
- Apply-and-bounce a corrected master

QC ONE FILE

- Click & glitch timeline · click-to-transport
- Distortion: clipping, ISR, harmonic
- Mains hum + 3rd / 5th / 7th harmonics
- Tape transfer artefacts: wow, flutter, drift
- Generation-loss detection (lossy ancestors)
- Key, BPM, harmonic ladder
- Mono-compatible waterfall · per band, not scalar
- Stereo image + per-band phase

SHIP A FOLDER

- Sortable batch table · LUFS, TP, LRA, ISRC
- Cohort heatmap · per-track 31-band drift
- .rtmalbum.json sessions · re-open in a year
- Delivery Manifest 3-way diff
- Atmos Preflight · object count, LFE, layout
- Per-object anomaly detection
- Ship-Ready PDF + Corrected CSV exports
- AI-gen detection · per stem

A/B COMPARE · LEVEL-MATCHED

Both files normalised to -18 LUFS before audition.

A · REFERENCE

reference.wav

-9.9 LUFS

B · YOUR MIX

rev_4_final_v2.wav

-7.1 LUFS

B is 2.8 LU louder. Levels matched, the panels show what changed besides volume.

WHY THIS ISN'T JUST ANOTHER METER

Per-band masking via AI stem separation.

Demucs splits both files into vocals, drums, bass, other.

RTMcompare measures per-band energy loss across 31 bands, per stem. So when your master sums and the vocals lose 3.2 dB at 2 kHz to drum bus competition, you see exactly that — not just "the mid-range is different."

The thing other compare tools don't have.

WHEN YOU ONLY HAVE ONE FILE

Drop one file in. We tell you what's wrong.

- Click & glitch timeline
- Distortion · clipping, ISR, harmonic
- Mains hum + harmonics
- Tape artefacts · wow, flutter, drift
- Generation-loss · finds lossy ancestors
- Key, BPM, harmonic ladder
- Mono-compatible waterfall · per band
- Stereo image + per-band phase

For when there's no reference, only the file and a deadline.

PROFILE MATCHING

Match against an engineer. Or yourself.

Bundled profiles: Serban Ghenea, Chris Lord-Alge, Tom Coyne, Bob Ludwig. Or build your own with RTMprofile from 5+ of your finished masters.

RTMcompare returns a match-score plus concrete EQ moves — frequency, gain, Q. Apply-and-bounce produces the corrected master in one click. No re-do.

SPECIALTY SURFACES

Two surfaces you only use if they're for you.

Delivery Manifest

Apple cancels deliveries on punctuation. Spotify rejects duplicate ISRCs without warning. DMR three-way-diffs your audio, the manifest, and the album's ISRC set. Catches every reason a release gets bounced. Exports Ship-Ready PDF + Corrected CSV the distributor can re-ingest.

For label ops.

Dolby Atmos

ADM BWF native. Bed and objects parsed, binaural-headroom estimated (ILD downmix), stereo downmix QC'd against the immersive master. Atmos Preflight runs Apple's hard-checks (object count $\leq$ 118, LFE routing, bed layout, SR = 48 kHz). Per-object anomaly detection flags hot, silent, static, dark objects.

For immersive mix supervisors.

TWO COMPANION APPS

RTMprofile

Feed it 5+ finished masters. It learns your sound and saves a fingerprint that loads into RTMcompare's Match tab. Or grade any new mix against an engineer profile already on disk.

RTMsend

VST3 / AU plugin. Sits on a bus in Wavelab, Logic, Pro Tools, Studio One. One button sends the buffer to RTMcompare's Single, Compare-B, or Album surface. ARA-aware on hosts that support it.

YOUR FILES STAY ON YOUR MACHINE

Local-first. No cloud round-trip.
